

Lithium networking meeting at the Latin American Studies Association Conference 2019

The meeting seeks to reach and link scholars working and/or interested in lithium and the low carbon energy transition policies in Latin America.

The event details are as follow: **“Defining and debating a research agenda for Lithium in South America”**
Fri, May 24, 17:45 to 19:15pm – SB Boardroom

The increasing demand for strategic resources such as lithium for the low-carbon energy transition will have important technological, geopolitical and socio-environmental consequences as profound as those which came with the shift to fossil fuels a hundred years ago. In the coming decade, the so-called lithium triangle in Argentina, Chile and Bolivia will play a key role as a provider of this resource for global policies on climate change and it will be also the scenario of geopolitical transformations.

This is a highly relevant agenda that has not been explored thoroughly and that has enormous potential for interdisciplinary collaborations and alliances among Latin American researchers. During the meeting, it will be discussed how to create and consolidate a network of collaboration and knowledge exchange and how to take forward this initiative.
